EPIDEMIOLIC NOTES AND REPORTS

INFLUENZA - Michigan and Florida

The first documented cases of influenza for the 1967-68 epidemiologic year have been reported to NCDC. The first reported outbreak affected approximately 3,000 of 18,500 students at Western Michigan University, Kalamazoo, Michigan, between October 23, and November 10, 1967. The peak incidence was reached during the week of October 28. The second outbreak occurred in the North Miami, Florida, public schools in early November with a peak in incidence on November 8 and 9.

At Western Michigan University approximately 1,000 students sought medical care at the University Health Service, and an estimated 2,000 more were ill, but did not

seek medical assistance. The illness was characterized by fever, malaise, headache, myalgia, cough, and retrosternal pain. Laboratory study of 11 paired sera from students showed 7 with fourfold rises to influenza A by complement-fixation (CF) test, and 4 with fourfold or greater rises against recent influenza A₂ antigens by

INFLUENZA - Michigan and Florida - (Continued from front page)

hemagglutination inhibition. The Respirovirus Laboratory at NCDC has confirmed these results.

During the University outbreak, absenteeism also increased in Kalamazoo's public schools. A similar illness was reported in Lansing, Michigan's public schools. The peak incidence occurred the week of November 21, when absenteeism reached 12 to 20 percent. Again paired sera showed diagnostic rises to influenza A₂ antigens. Attempts are presently being made to isolate the virus.

In the Florida outbreak, paired sera from 2 patients had diagnostic serologic rises by CF tests against in-

fluenza A. In mid November, one case of influenza was diagnosed by a local physician in Jacksonville, Florida, and confirmed by the Florida State Laboratory by CF serology test against influenza A.

(Reported by George H. Agate, M.D., M.S.P.H., Chief, Division of Epidemiology, and Maurice Becker, Ph.D., Chief, Virology Section, Division of Microbiology, Michigan Department of Public Health; E. Charlton Prather, M.D., M.P.H., Director, Division of Epidemiology, Florida State Board of Health; Respirovirus Unit, Laboratory Program, NCDC; and 2 EIS Officers.)

SURVEILLANCE SUMMARY
INFLUENZA - 1967-68

A review of pneumonia-influenza mortality reported to the National Communicable Disease Center by 122 United States cities shows only minor excursions above the expected number from January through mid November 1967 (Figure 1). Small rises in mortality in mid August and mid October were observed, but pneumonia-influenza mortality for the United States as a whole has not reached

epidemic thresholds. Similarly pneumonia-influenza mortality data for the 9 geographic areas in the United States do not reflect significant or sustained levels of excess mortality.

Editorial Note: The basis of the construction of the National Pneumonia-Influenza Mortality Chart is described in the MMWR, Vol. 14, No. 1 of January 9, 1965, pp. 8-9.

PNEUMONIA-INFLUENZA DEATHS IN 122 UNITED STATES CITIES

CURRENT TRENDS
MEASLES

For the 48th week, 248 cases of measles were reported. To date, there have been 60,738 reported cases in the United States, a substantial reduction from the 197,985 cases reported for the same period in 1966, previously the record low year.

The decline in the numbers of reported measles cases since 1962 in 6 states is shown in Figures 2 and 3. State-wide vaccination programs have been conducted in Rhode Island, Maryland, and Utah. In each of these states measles incidence has declined dramatically, even though

surveillance and case finding efforts have been intensified. A similar decline in reported cases has also occurred in Massachusetts, Michigan, and Pennsylvania (Figure 3). In these states no statewide campaigns were conducted, however, community-wide and on-going immunization programs have produced a marked decline in reported measles cases. Most vaccine utilization in these states has been associated with intensification of continuing programs of immunization of preschool and young school aged children.

INTERNATIONAL NOTES PARA-INFLUENZA – Port-of-Spain, Trinidad

A para-influenza epidemic with five deaths among more than 250 hospitalized children occurred in Port-of-Spain, Trinidad, between October 1, and November 26, 1967. Over 50 percent of the patients were under age 2. Clinical illnesses ranged from severe upper respiratory infections to bronchitis, bronchiolitis, and bronchopneumonia. Severely ill children developed variable degrees of fever, productive cough, pharyngitis, dyspnea, rales, rhonchi, and bronchospasm. Axillary temperatures were usually under 102°F, however several children had higher temperatures accompanied by febrile convulsions. X-rays

of children with pneumonia showed diffuse bilateral peribronchial infiltration. With treatment most children recovered within a week from onset.

Virus obtained from throat swabs of acutely ill children produced hemadsorption in Rhesus monkey kidney tissue cultures. Lab results from the Trinidad Regional Virus Laboratory and NCDC confirmed the agents as members of the para-influenza group. Since October 1, 20 isolates were typed; 15 were para-influenza I; 5 were para-influenza III. Epidemiologic and laboratory studies are continuing.

PARA-INFLUENZA – Port-of-Spain, Trinidad
(Continued from page 403)

Previous studies by TRVL implicated para-influenza viruses in sporadic respiratory illness and respiratory syncytial virus as the principal cause of epidemics among pediatric patients. In 1964, an outbreak of respiratory syncytial virus infections occurred among infants in Port-of-Spain. Over 60 cases were documented by virus isolations or serologic studies. During 1964-66, para-influenza viruses were isolated sporadically from children with respiratory diseases. For the 3-year period, 6 isolates of para-influenza I, 1 isolate of para-influenza II, and 24 isolates of para-influenza III were recorded. However, the occurrence of a large epidemic due to para-influenza agents is an epidemiologic pattern not previously recognized in the Eastern Caribbean.

(Reported by Dr. L. M. Comissiong, Chief Medical Officer, Ministry of Health, Government of Trinidad and Tobago; Dr. L. Spence, Director, Trinidad Regional Virus Laboratory, University of the West Indies; and an EIS Officer.)

QUARANTINE MEASURES

*Immunization Information for International Travel
 1967-68 edition—Public Health Service Publication No. 384*

Section 5 AMERICA

St. Pierre and Miquelon Islands – Page 48

SMALLPOX

Insert: Smallpox vaccination required of arrivals from infected areas, and from countries in Africa, in America (Except Canada and United States of America), and in Asia.

CHOLERA

Insert: Cholera vaccination required of arrivals from infected areas by air, 6 months of age and over.

ERRATUM, Vol. 16, No. 47, p. 394

In Figure 2 delete block representing fatal case on October 11.

THE MORBIDITY AND MORTALITY WEEKLY REPORT, WITH A CIRCULATION OF 17,000, IS PUBLISHED AT THE NATIONAL COMMUNICABLE DISEASE CENTER, ATLANTA, GEORGIA.

DIRECTOR, NATIONAL COMMUNICABLE DISEASE CENTER DAVID J. SENCER, M.D.
 CHIEF, EPIDEMIOLOGY PROGRAM A.D. LANGMUIR, M.D.
 ACTING CHIEF, STATISTICS SECTION IDA L. SHERMAN, M.S.
 EDITOR, MMWR MICHAEL B. GREGG, M.D.
